

Project Design Phase

Problem – Solution Fit Canvas

Date:	03 October 2026
Team ID:	SWTID-2026-3257
Project Name:	Implement Client Script & UI Policy (Incident Table)
Maximum Marks:	2 Marks

1. Purpose & Overview of Problem-Solution Fit

The Problem-Solution Fit validates that the proposed solution actually solves the target user's problem in a way that aligns with their operational behavior. By implementing dynamic UI Policies and event-driven Client Scripts on the Incident table, this project bridges the gap between Service Desk operational friction and seamless ITSM compliance.

- Solve complex form usability problems in a way that fits the high-volume environment of IT support staff.
- Increase solution adoption by embedding real-time dynamic validations directly into the existing ServiceNow Agent Workspace.
- Sharpen form interactions with clear contextual triggers (e.g., State changes, Priority escalations).
- Build trust and data compliance by automatically enforcing mandatory resolution fields and securing closed incident records.

2. Problem – Solution Fit Canvas Matrix

Canvas Building Block	Application Details to Incident UI Policy	Code
1. CUSTOMER SEGMENT(S)	IT Service Desk Analysts (Tier-1/Tier-2 Support Technicians), Incident Managers, and ITSM Administrators.	CS
2. JOBS-TO-BE-DONE / PROBLEMS	Log incoming user issues rapidly, triage priority, assign tickets accurately, and document mandatory resolution notes without getting bogged down by clutter.	J&P
3. TRIGGERS	State transitions on Incident records (e.g., moving to 'Resolved' or 'Closed'), Priority level changes (P1 Critical), or dropdown updates (Impact/Urgency).	TR
4. EMOTIONS: BEFORE / AFTER	BEFORE: Frustrated by 30+ visible fields, anxious about missed mandatory inputs, overwhelmed by post-submit save errors.	EM

	AFTER: Confident, fast, guided by dynamic forms, relieved by zero-latency client-side validations.	
5. AVAILABLE SOLUTIONS	Static incident forms displaying all fields at once, manual cheat-sheets, post-submission server validation popups, and periodic manual audits.	AS
6. CUSTOMER CONSTRAINTS	High ticket volume during call shifts, strict SLA resolution windows, limited time for extensive training, and browser rendering constraints.	CC
7. BEHAVIOUR	Analysts manually scroll through busy forms while talking to customers, occasionally entering filler text if irrelevant fields are made forced too early.	BE
8. CHANNELS OF BEHAVIOUR	- Online: ServiceNow Service Operations Workspace, Browser Agent Interface. - Offline: Support desk phone calls, IT team huddles, shift handover reviews.	CH
9. PROBLEM ROOT CAUSE	Absence of dynamic client-side UI Policies and event-driven scripts, resulting in static form configurations that treat all incident states identically.	RC
10. YOUR SOLUTION	Declarative UI Policies (dynamic visibility, mandatory enforcement for P1/Resolved state, read-only lock for Closed state) + Client Scripts for real-time priority matrix auto-calculation.	SL

3. Problem-Solution Fit Alignment Analysis

- **Form Clutter vs. Dynamic Visibility (CS + J&P -> SL):**

Analyst frustration with 30+ visible fields is solved by keeping Resolution Code and Resolution Notes hidden during initial logging, revealing them only when State = Resolved.

- **Incomplete Submissions vs. Dynamic Mandatory Rules (BE + RC -> SL):**

Support analysts skipping critical details under high call volume is solved by enforcing mandatory Work Notes and Assignment Groups dynamically on Critical (P1/P2) incidents.

- **Post-Closure Tampering vs. Read-Only Policy (RC -> SL):**

Risk of accidental or unauthorized modifications to closed tickets is solved by automatically locking all incident fields to Read-Only once State reaches Closed.

- **Slow Manual Triage vs. Client Script Priority Matrix (CC + TR -> SL):**

Time lost manually looking up priority matrices is eliminated by an onChange Client Script that instantly recalculates Priority from Impact and Urgency on the browser client.
